

A B S T R A C T

The household electrical appliance comprises a support and a waffle-iron which pivots on the support
5 about an axis and which has a pivot pivotally mounted on a bearing carried by the support. In the invention, the pivot is secured to a first panel of the waffle-iron and has a housing which is adapted, when the two panels are in the closed position, to receive a locking element
10 secured to the other panel, and the bearing has an opening disposed so as to allow the locking element to pass freely for opening and closing the waffle-iron when it is in its working position, and to prevent the two panels from opening when it is in its upside-down
15 position.
